

# Where a large load can actually connect.

Grid-capacity intelligence for data-centre site selection

Screen candidate sites, quantify uncertainty, and prepare an evidence-backed path to operator validation.

# The grid is not a late-stage check.

## It decides whether the project exists.

- 1 Write to the relevant operator
- 2 Wait while the request moves internally
- 3 Network specialists test the connection
- 4 Receive an answer—often after site capital is committed

### THE COST OF UNCERTAINTY

A “no” can mean a new site, a new request, and the wait starts again.

GridPulse moves grid feasibility to the start of site selection.

# Drop a pin.

## We rank the grid around it.

*A repeatable screening workflow—before formal DSO/TSO confirmation.*

# One answer is not enough.

## We expose the range—and why it moves.

### CAPACITY ENVELOPE

#### Plausible MW range

Conservative

Base case

With flexibility

#### Confidence

How reliable the estimate is

#### Constraint map

What limits the connection

#### Evidence class

Public, inferred, simulated or validated

#### Next action

What to ask the operator

# Physics first.

## AI where it adds leverage.

**BOUNDARY**

AI does not invent available MW. Operator-grade network evidence is required before capacity is treated as confirmed.

**The pain is real.**

**The buying signal is concrete.**

**3**

developer conversations

**€100–500M**

project-size range discussed

**€2,000 / month**

price point tested

**The scarce asset is not another map—it is trusted, decision-grade evidence about where power is plausible.**

# Built at the intersection of grid engineering and commercial execution.

BUSINESS — CUSTOMERS, REVENUE, SALES
